

AlbacMat

The AlbacMat $\text{C}\epsilon$ is a flexible stretcher that can be used to evacuate patients from nursing homes, residential homes and hospitals.

In the event of fire or similar emergencies the AlbacMat $\text{C}\epsilon$ can be used to remove immobile patients from beds, operating theatres, chairs, or from the floor. It is suitable for both horizontal and vertical evacuations.

The AlbacMat $\text{C}\epsilon$ consists of a red nylon sheet bonded to a polypropylene flexible board. The board allows the AlbacMat $\text{C}\epsilon$ to glide over most types of surface including carpet, vinyl, concrete, bitumen and grass. Velcro straps restrain the patient while a foot pocket secures the feet. Various handles allow one or two people to safely evacuate patients from hazardous situations.

Vertical evacuation

Standard AlbacMat
